Fly Board Air, how it works, maybe? Invented in big part at least by [Franky Zapata](#)

My Little Theory. SEE crazy [Video here...](#)

So just how could this work? Now his water based board moves enough water to propel a good-sized man [not my size, a good size as in 160 pounds] STRAIGHT UP, with WATER. No easy feat by itself. I first saw this at Hulk Hogan's Bar in Tampa WOW I was really impressed. BUT how could he do this. WELL Here's my thoughts, unless pure BS:

- 1- He is not using batteries, [not for lift power] but has a highly compressed H₂ Tank of liquid Hydrogen in his back pack. We are talking NOT scuba sized, but a nice sized fire extinguisher size --- like in the back of your car].
- 2- Battery only to manage his HIGH Speed Gyro. He had to have got the Gyro from some Military dealer.
- 3- he probably has a converter/generator to supply power to his directional fans [two], probably DC and linked directly to the Gyro mech
- 4- The MAIN kick comes from his big burner, which burns H₂ and blasts it straight down. A YYYUUUGE kick from this. .

.....Now problems would be 'course management' correction, which there is NO way he developed on his own. If so, he is perhaps some kind of super genius. The Gyro used would be Space Age stuff. The same kind required to manage rockets/ICBMs!!! Sorry BUT he is clever enough though to have figured out the simplicity and raw power he would get from burning Hydrogen. He may also use a finely carburetor-type O₂ injector, for extra high energy efficiency. SO yes without cracking open a calculator, logs and Calculus Tables. Yes this is possible, but NOT without the gyro and HE did NOT invent that for sure!
